

Negative Output Low Drop Out voltage regulator

■ GENERAL DESCRIPTION

The NJM2828 is a negative output low dropout regulator. Advanced bipolar technology achieves low noise, high precision voltage and high ripple rejection.

It has soft-start and shunt SW function. 1.0 μ F Output capacitor and small package can make NJM2828 suitable for portable items.

■ PACKAGE OUTLINE

SC88A

NJM2828F3

■ FEATURES

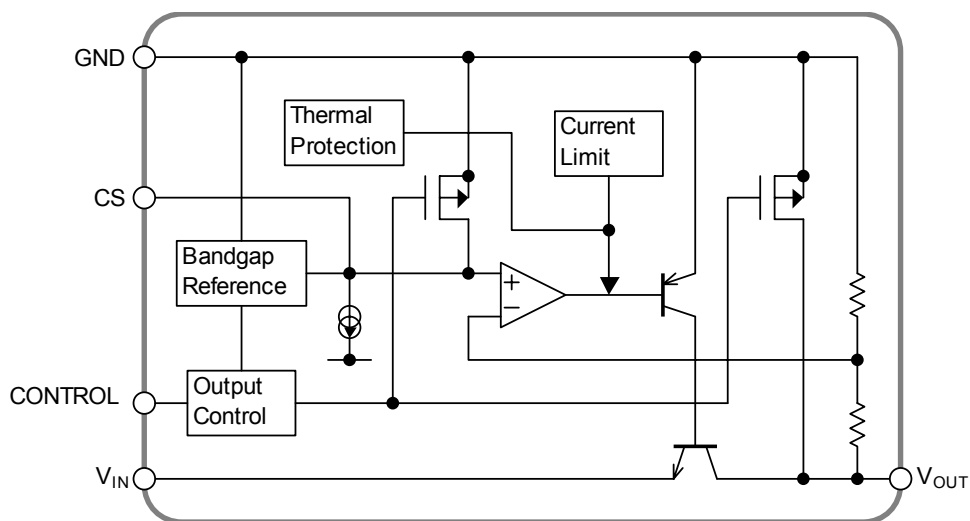

- Low Current Consumption 0.13V (typ.) @ $I_o=60\text{mA}$
- High Precision Output $\pm 1.5\%$
- High Ripple Rejection 65dB(typ.) @ $f=1\text{kHz}$, $V_o=-7\text{V}$ Version
- Output capacitor with 1.0F ceramic capacitor.
- Output Current $I_o(\text{max.})=100\text{mA}$
- ON/OFF Control(Positive voltage control from 0 to +5V)
- Soft-start Function
- Shunt SW Function
- Internal Thermal Overload Protection
- Internal Short Circuit Current Limit
- Bipolar Technology
- Package Outline SC88A

TEST CIRCUIT

*3 $-2.2V \leq V_o < -2.0V$ version : $C_o = 2.2\mu F$ (Ceramic)
 $V_o \geq -2.0V$ version : $C_o = 4.7\mu F$ (Ceramic)

■ TYPICAL APPLICATIONS

*ON/OFF control

ON/OFF control can be achieved by applying positive control voltage to CONTROL terminal.

Apply positive V_{cont} ("H") to make chip to be ON (Enabled), and either V_{cont} is "L" or open (High Z) to make chip to be OFF (Disabled).

The relations between V_{cont} and the state is as follows:

$V_{cont} + 1.6V \leq V_{cont} \leq +5V$ ("H" level):	ON state
$V_{cont} 0V \leq V_{cont} \leq +0.6V$ ("L" level):	OFF state
$V_{cont} + 0.6V < V_{cont} < +1.6V$ ("L" level):	Undefined

In case ON/OFF control is not used, keep applying positive V_{cont} to CONTROL terminal to make chip ON.

Note that negative V_{cont} does not make the chip enabled.

*4 $-2.2V \leq V_o < -2.0V$ version : $C_o = 2.2\mu F$
 $V_o \geq -2.0V$ version : $C_o = 4.7\mu F$

*In the case of using a resistance "R" between V_{IN} and control.

If this resistor is inserted, it can reduce the control current when the control voltage is high.

The applied voltage to control terminal should set to consider voltage drop through the resistor "R" and the minimum control voltage for ON-state.

The $V_{CONT(ON)}$ and I_{CONT} have temperature dependence as shown in the "Control Current vs. Temperature" and "Control Voltage vs. Temperature" characteristics. Therefore, the resistance "R" should be selected to consider the temperature characteristics.

*Input Capacitance C_{IN}

Input Capacitor C_{IN} is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended C_{IN} value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{IN} as shortest path as possible to avoid the problem.

*Output Capacitance C_O

Output capacitor (C_O) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller C_O may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger C_O reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended C_O value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{OUT} as shortest path as possible for stable operation

The recommended capacitance depends on the output voltage rank. Especially, low voltage regulator requires larger C_O value.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting C_O , recommend that have withstand voltage margin against output voltage and superior temperature characteristic.

*Soft-start function

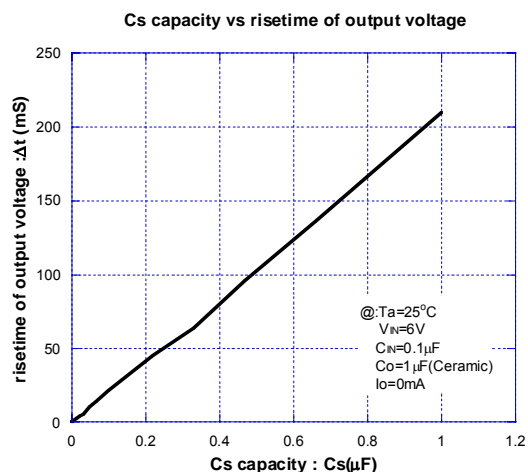

Capacitance C_s connect between CS pin and GND for the following.

- Control at risetime of output voltage.
- Reduces inrush current at output ON.

When the soft start function is not used, CS pin should be open.

1. C_s capacitance vs risetime of output voltage

Calculation : risetime of output voltage Δt (ms) $\cong 213 \times C_s$ (μF)

2. Inrush current at control ON

The peak value of the inrush current can be limited according to the capacitance of the C_s .

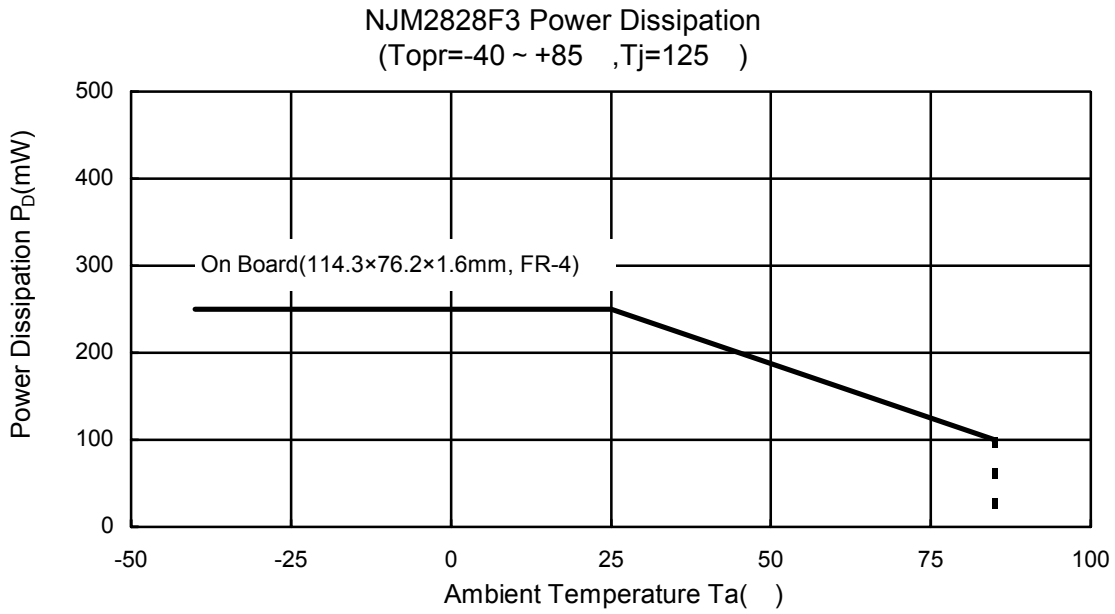

Inrush current wave :

* This characteristic is one example. It is necessary to examine the characteristic with an actual circuit because there is an influence by the characteristic such as output voltage/output capacitor.
